

## **SALT asks for your input on our work with regards to climate and the environment**

SALT Lofoten AS (hereafter SALT) wants to contribute to a more sustainable world and will therefore take responsibility for our impact. An important part of our efforts is to be Eco-Lighthouse certified. This means that we have established an environmental management system that guides our climate and environmental work and helps us to improve continuously. The certification also contains specific requirements for the following topics: work health and safety, waste/reuse, energy, procurement, and transport. Every year, we report activity data which results in a greenhouse gas account, as well as results and statistics. This information provides a good overview of progress and potential for improvement, and is made publicly available.

Part of the Eco-Lighthouse certification addresses the interaction between companies and society. Customers, partners and other stakeholders are therefore invited to provide input on how the climate and environmental impact of our goods / services can be improved. The input gives us useful insight on what needs and expectations you have for SALT in the coming years.

SALT has an overarching policy for Health, Environment and Safety, with clear goals for our work in this area. The HSE manager in SALT annually follows up on goals and measures for compliance with our HSE routines, which is reported to SALT's management team and board annually.

**Do you have input on how the climate and environmental impact of goods / services can be improved at SALT? Please send suggestions to [post@salt.nu](mailto:post@salt.nu)**

We look forward to working together for a more sustainable world,

Sincerely,

Kjersti Eline Tønnessen Busch

CEO, SALT
